

**Compact, fast, reliable.** Inductive, capacitive and magnetic sensors.

Sensor Solutions  
Motion Control  
Vision Technologies

Around the globe, automation would not be the same without non-contact inductive proximity sensors. For decades, millions of such metal-detecting devices have been monitoring presence, measuring movement and position of machine parts, valves and gears. Reliably. Day in and day out. Even in high-speed applications, exposed to the toughest industrial conditions, inductive proximity sensors safely detect steel targets as well as non-ferrous metal targets. The sensors provide feedback with precise switching points and extremely high repeat accuracy.

The range of inductive 3-wire sensors consists of two basic designs:

- Sensors with digital output providing accurate on/off information
- Sensors with analog output signals providing absolute distance information

Both technologies are available in a wide range of housing styles ranging from subminiature to standard size enclosures. Special custom solutions are available for OEM requirements.

Inductive sensors are undoubtedly the best tested and best proven sensor technology on the market. Because of this, they are still going strong and continue to provide good and reliable solutions for many challenging tasks in the world of automation.

# **Powerful and flexible standard sensors**

## **You as the client set the standard!**

You can choose from Baumer's wide range of inductive and capacitive sensors. Baumer's new miniature range fully meets the current demand for highly compact models with great sensing distances. Sensor sizes with diameters of 6,5 mm and more offer a four times greater sensing distance and models with M12 or larger housings can sense at distances up to five times greater. You can choose from three different housing materials: nickel-plated brass, chrome-nickel steel 1.4305 or plastic to suit your application needs.

## **Three different housing lengths!**

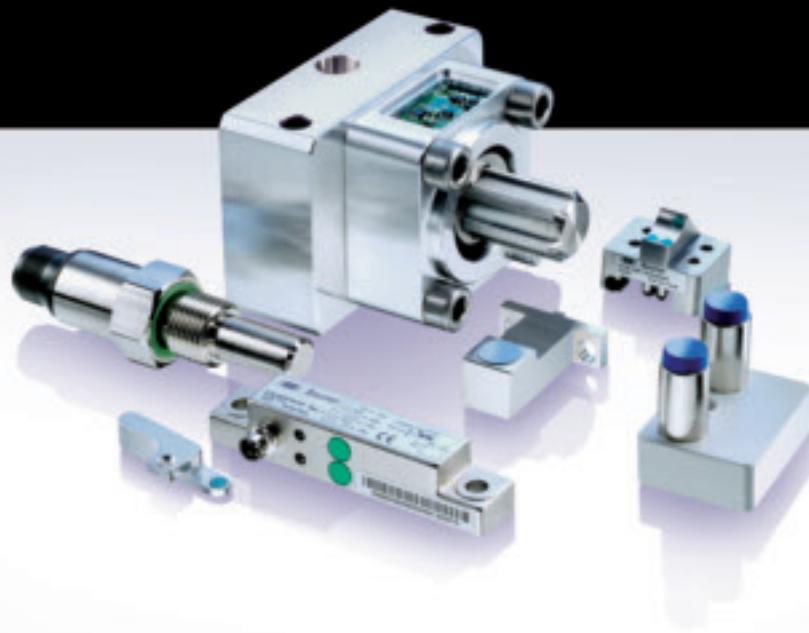

Short and sweet is how we make them, which gives you all the benefits of longer sensors in a much smaller housing. Nothing on earth can beat our star product with the world's shortest installation length of barely 28 mm, naturally equipped with M8 x 1 plug connector.

You want it longer? No problem – simply pick the medium-sized or long version, also available in a cable version!

## **Plug connector**

Compact sensors require space-saving plug connectors too. Our range now includes the new M5 x 0,5 plug connector for our miniature series. We rely on the well-tested M8 x 1 and M12 x 1 connectors for our medium-sized and larger models. They naturally come in both straight and angular configurations.

# *Special versions according to customer specifications*

Special versions according to customer specifications  
Baumer's comprehensive range of standard inductive  
sensors satisfies most engineering and design re-  
quirements. Nevertheless, should you encounter an  
application that cannot be solved with an „off the shelf  
product“:

Baumer has years of experience in tailor made sensor  
solutions, a small selection of which is displayed on this  
page for your reference.

Our R & D team is up to the challenge of tackling your  
every sensing need with products customized to your  
application.

**Try us. Present your specification sheet today!**

# *AlphaProx Inductive distance measuring sensors with high resolution 0,1 µm*

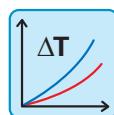

Whether in industry, the construction field or process chemistry, it always requires a team of competent specialists to create strong solutions.

Baumer too puts its faith in a "team" when it comes to finding solutions for industrial applications. This team is known as *AlphaProx* and comprises a family of high-quality, inductive analog sensors. Each sensor displays an individual specification which is ideally matched to its specific application areas.

## **Miniature housing**

The trend towards miniaturization is unstoppable, even when it comes to distance measuring sensors. With a diameter of 4 mm, the IWRM 04 likely holds the title as the smallest inductive distance measuring sensor with an integrated amplifier.

## **Temperature stability at the greatest measurement distances**

High temperature stability at the greatest possible measuring distance represents a further strength. Over 80 % of all distance measuring applications operate at ambient temperatures between +20 ... +50 °C. Our sensors exhibit a negligibly small temperature drift in the range between 0 ... +60 °C.

## **Flexibility through Teach-In**

Sensors with Teach-in inputs can be optimally adapted to their individual applications. The extremely simple Teach-in routine allows not only the analog output to be influenced, but also an additionally integrated switching output.

## **Very high EMI resistance**

Resistance to electromagnetic interference is one of the most significant factors for the practical employment of sensors. Our sensor's EMI resistance limit values lie significantly above the specifications defined by the sensor standard, thus ensuring extremely high operational security.

## Absolute linear and angular measurement

- Absolute linear measurement
- High reliability through contactless measurement
- Dirt-resistant measuring system
- Linear ways greater than the sensor measuring range can be measured
- Linear and rotary movements can be measured
- Compact sensor designs permit installation in even the most limited spaces

## Belt tension regulation and monitoring

- High regulation quality at large frequencies is possible
- The sensor performs two functions: linear measurement (analog) and end position shutoff (digital)
- Using Teach-in, the sensor's measuring range can be optimally adjusted to the roll diameter

## Vibration measurements on shafts and bearings

- Bearing play or true running measurements
- Measurements of distances down 1 µm
- Installation in even the most limited spaces (the amplifier is integrated in the sensor)
- Very rapid movements can be measured
- Miniature sensors also available in connector versions

# Miniature versions of inductive sensors

The trend towards ultra compact machines and devices is here to stay. Baumer recognized this trend early on, resulting in the development of the world's smallest inductive sensors. A complete range of different sizes and enclosure shapes is perfectly matched to applications where space is scarce.

## Miniature versions

- Smallest ø 3 mm sensor
- Unthreaded housing designs for ø 3 mm, ø 4 mm, ø 6,5 mm
- Steel housings with threads for M4, M5 and M8 dimensions
- Rectangular sensors for 4 mm, 6 mm, 8 mm dimensions

## Special versions in miniaturized design

- 2-wire NAMUR versions in dimensions from 4 to 8 mm
- 2-wire NAMUR button sensors for mounting directly on PCBs in 10 mm dimension
- Measuring sensors with analog output (current/voltage) in dimensions from 4 to 8 mm

## Electrical connection

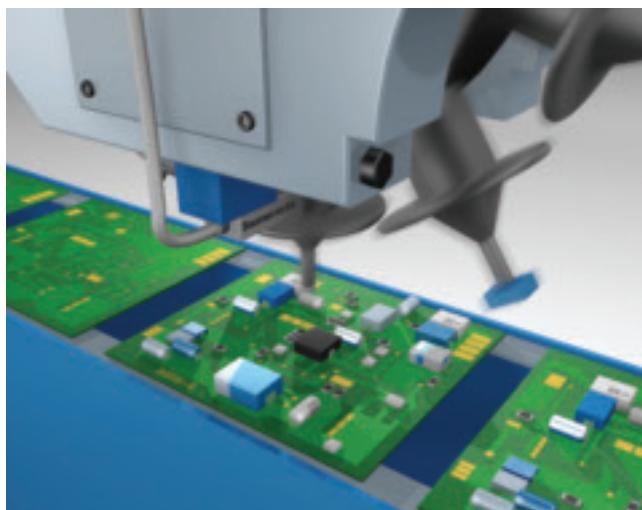

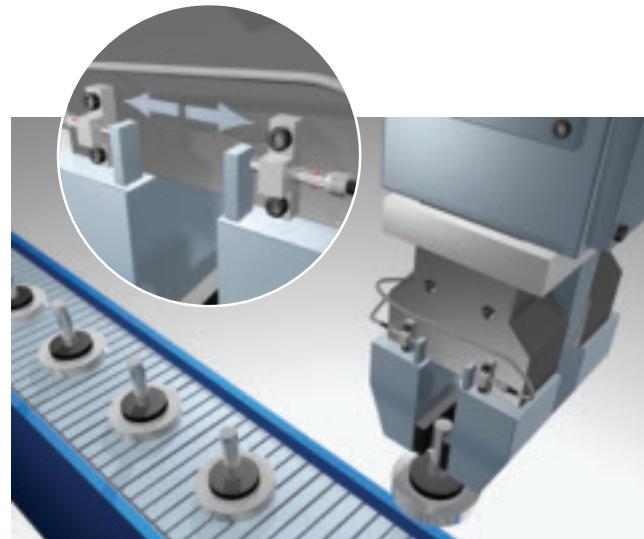

- PUR and PVC leads
- M5 x 0,5 miniature connectors
- M8 x 1 connectors

## Application examples for miniature sensors

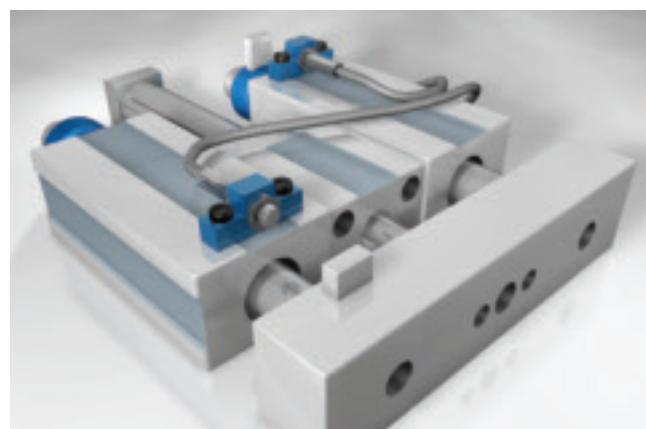

### Robot grippers

- Gripper jaw end position detection
- Workpiece presence/absence check
- Miniature sensors designed for limited space conditions

### Automatic SMD population equipment

- Synchronization of processes
- Precise position determination
- Absolute spacing measurement at high resolution

### Linear unit

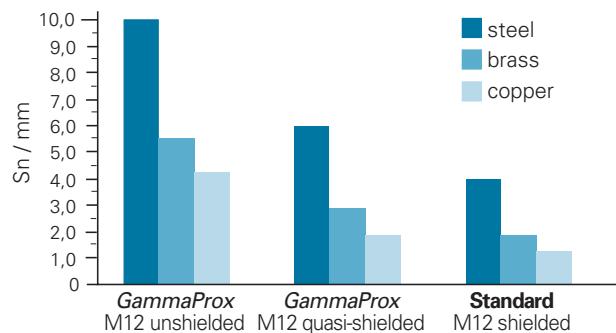

- Return report of the end positions
- Referencing / initialization

# *GammaProx Sensors with increased sensing distances*

## **Five times greater sensing distance than the CENELEC standard**

The sensing distances of the *GammaProx* line of sensors is up to five times that required by the CENELEC standard. This allows both steel and nonferrous metals to be effectively and reliably detected. The increased sensing distance generally permits greater distances to the moving objects to be selected which, in turn, allows greater mounting tolerances and helps to prevent mechanical damage and increase the overall reliability of the equipment.

## **Quasi-shielded installation method**

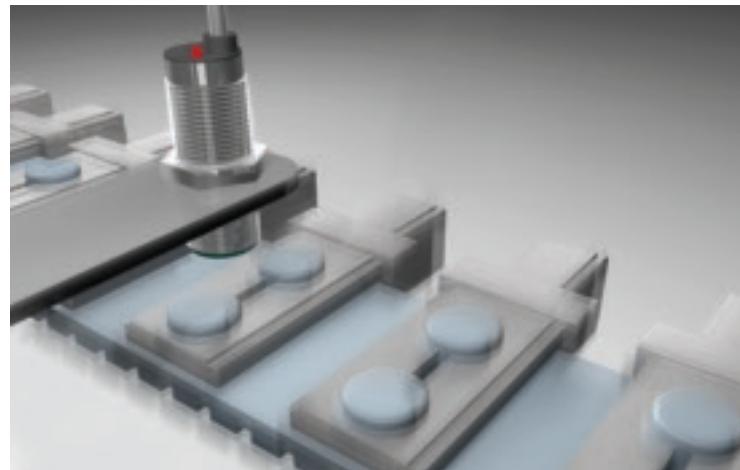

When installing quasi-shielded sensors in ferromagnetic metals, special installation instructions must be observed. In non-ferromagnetic materials such as copper, brass and aluminum, the sensors can be installed shielded.

## Application examples for *GammaProx* sensors

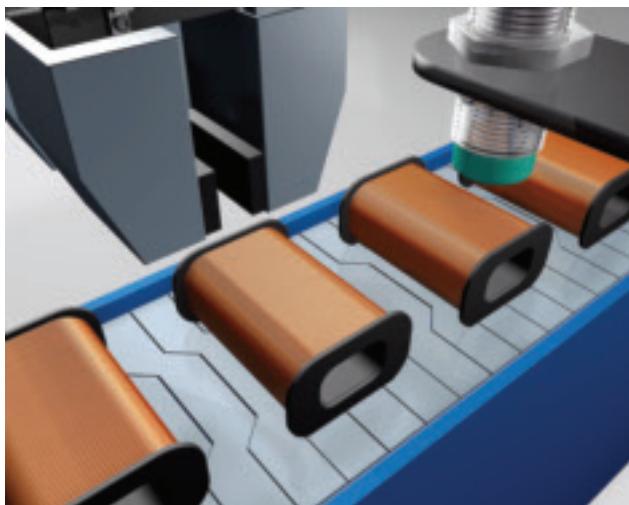

### Detection and counting of metal objects

- Where object distances vary greatly (mechanical tolerance compensation)
- Reliable detection of varying object sizes
- Detects a variety of metals (lowering the influence of the reduction factor)
- Also detects plastic-coated metals reliably

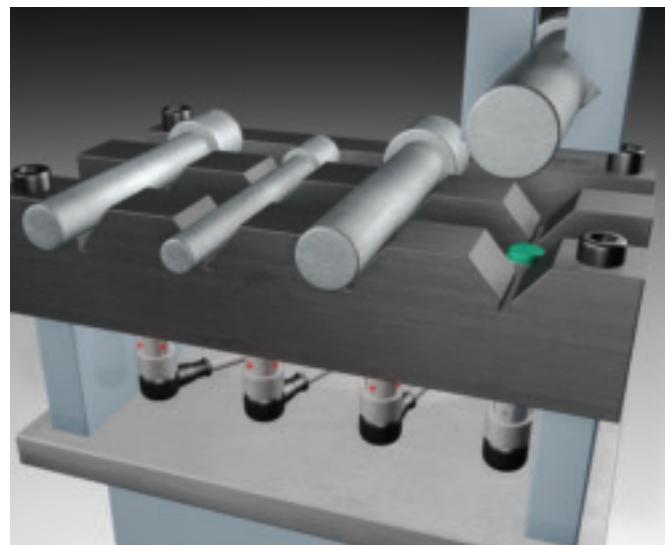

Application examples for *GammaProx* sensors

### Coil and transformer production

- Detection of copper windings
- Quality control during spool manufacturing
- Can be employed on automatic winders

### Handling and robotics

- Presence detection for tool pickups
- Permits greater mounting tolerances
- Reliable detection even where object distances vary greatly

# DuroProx Inductive sensors with rugged full metal housings

## DuroProx Designed for daily use under harsh industrial conditions

DuroProx sensors are built to take it in every sense. The inductive sensors with their full metal housing ( $\varnothing$  6,5 to M18) providing IP 69K class protection were designed from the outset for harsh and demanding industrial applications. Thanks to an operating temperature range from -25 ... +100 °C and a housing made of V4A stainless steel, these sensors are equally at home in food handling applications, cutting oil environments and any other applications where heavy contamination is a factor. They also function flawlessly under conditions of severe EMI pollution thanks to both their full metal housing with an active surface made of stainless steel and increased noise immunity in accordance with EN 61000-6-2.

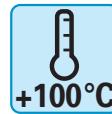

### Quasi-shielded installation method

When installing quasi-shielded sensors in ferromagnetic metals, special installation instructions must be observed. In non-ferromagnetic materials such as copper, brass and aluminum, the sensors can be installed shielded.

### Highest protection class

The family of DuroProx sensors meets the requirements of protection class IP 69K and is practically predestined for use in the food handling industry.

### Large operating temperature range

The temperature span across which DuroProx sensors can be reliably employed ranges from -25 ... +100 °C.

### Full metal housing

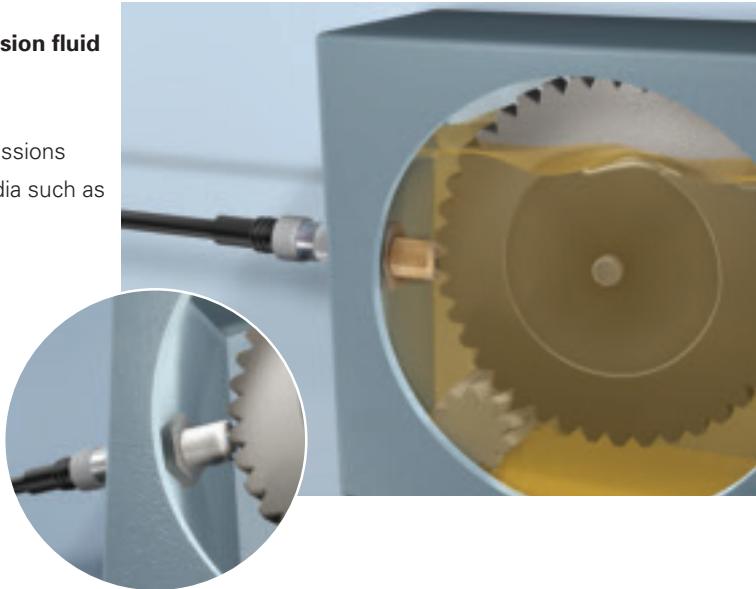

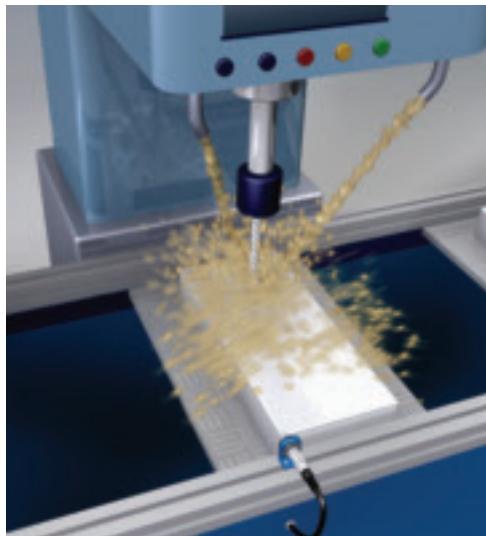

The entire housing, including the active surface is made of V4A (1.4404) stainless steel. This makes DuroProx highly resistant to abrasive and chemically aggressive media such as acids, bases and salt water and is according the food and beverage standards.

## Application examples for *DuroProx* sensors

### Long-term employment – Directly exposed to transmission fluid or motor oil

- Motor rpm counters
- Position reporting in transmissions
- Resistant to aggressive media such as oil additives

### Continuous employment in wet cells

- During production processes involving cutting (CNC)
- Subjected to the influence of cutting, grinding and cooling/lubricating agents

### Food processing industry

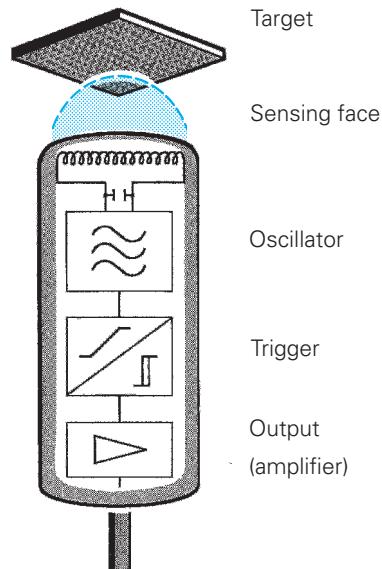

- Direct contact with foods (V4A steel)
- Cleaning using high-pressure water and steam
- Resistant to industrial detergents

## The sensor

Baumer inductive proximity switches are non-contact electronic sensors. They consist of three components: Oscillator, Schmitt Trigger and Output.

Inductive sensors will recognize any conducting metal target. Care must be taken when specifying a sensor to take into account correction factors due to target material. It is also important to ensure that target size guidelines are met.

## Operation

The oscillator creates a high frequency electromagnetic field, which radiates from the sensing face of the switch. When a conductive metal object enters this electromagnetic field, eddy currents are induced within the metal, causing a change in the amplitude of the oscillations. The result is a voltage change at the output of the oscillator, which causes the trigger to change state and alter the output state.

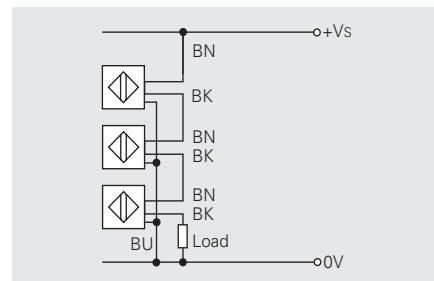

## Output

Standard DC proximity sensors use digital on/off NPN or PNP transistor outputs. Analog DC outputs are available on the NAMUR range (current) as well as on the inductive linear sensor range (voltage and current).

## Series switching

### 3-wire DC (PNP circuit shown)

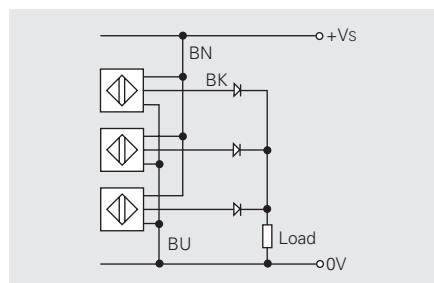

The voltage drop across each conducting sensor reduces the voltage available to drive the load. The number of proximity switches which can be connected in series is therefore limited and may be worked out by summing the individual voltage drops plus the load requirement.

## Parallel switching

### 3-wire DC

3-wire DC sensors may be connected in parallel as shown. A parallel connection, however, must incorporate a decoupling diode.

# Technical specifications

## Sensing distance

The IEC defines the sensing distance ( $s$ ) in the international Standards IEC 60947-5-2 as follows:

### Sensing distance

Sensing distance is defined as the distance at which the output signal is triggered when a standard target is moving towards the active sensor face.

### Nominal sensing distance $s_n$

Nominal sensing distance is defined as a classification, that does not take into account either manufacturing tolerances or variations due to external conditions.

### Real sensing distance $s_r$

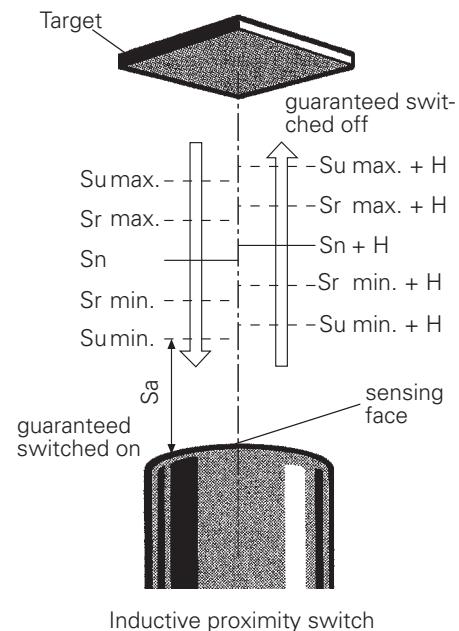

At nominal voltage ( $V_n$ ) and nominal ambient temperature of 20 °C (68 °F) the real sensing distance has to be in the range of 90% to 110% of the  $s_n$ . ( $0,9 \times s_n \leq s_r \leq 1,1 \times s_n$ )

### Usable sensing distance $s_u$

Usable sensing distance is defined to be within the allowable range for the operating voltage and ambient temperature in the range of 90% to 110% of the  $s_r$ . ( $0,9 \times s_r \leq s_u \leq 1,1 \times s_r$ )

### Operational sensing distance $s_a$

The safe operational sensing distance lies between 0% and 81% of the  $s_n$  ( $0 \leq s_a \leq 0,9 \times 0,9 \times s_n$ )

Inductive proximity switch

### Standard target

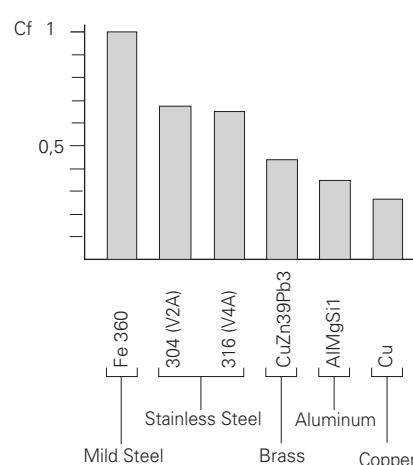

The standard target is defined as a square plate, 1 mm thick, made of Fe 360 (mild steel). The length of its side is defined as the larger of either the sensing face diameter or three times  $s_n$  (nominal sensing distance).

## Correction factor

If the target material differs from the standard target (as defined above), then the applicable published sensing distance must be multiplied by the appropriate correction factor (Cf).

Note: The published figures should be taken as a guideline only. Targets which differ in size and shape from the standard geometry may also give a different sensing distance when compared to the figures stated in the data sheets.

When sensing aluminum foil or non-metallic materials coated with a thin layer of aluminum or copper, the sensing distance achieved may be close to the value of mild steel. Actual  $S_n$  depends on the thickness of the layer as well as the alloy composition.

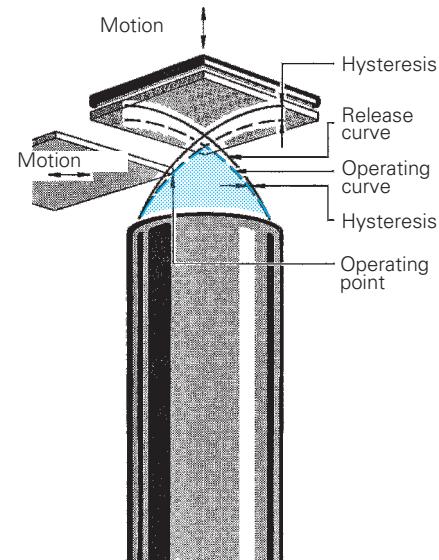

## Sensing characteristics

### Hysteresis

At approach and removal of the target, there is a difference between operating and release point which is defined as Hysteresis.

Hysteresis is designed into a sensor's characteristics to guard against possible incorrect pick-up due to vibration.

### Repeatability

The repeatability of the actual switching point of two successive switchings within 8 hours, at an ambient temperature between +15 °C and +30 °C, and a voltage of  $\pm 5\%$  deviation from nominal, is  $\pm 5\%$ .

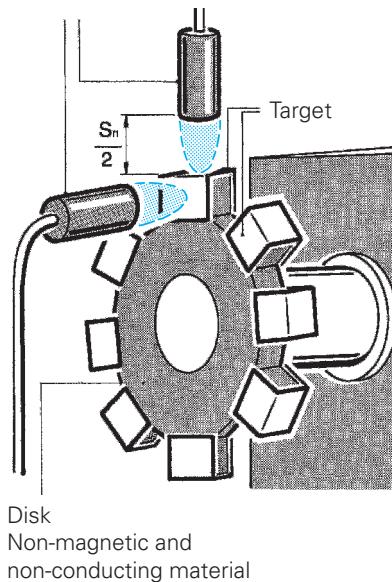

### Temperature range

The normal temperature range is between -25 °C and +75 °C. Please call should your application require installations in areas where this range may be exceeded.

### Switching frequency

Inductive proximity switches

Meeting EN 50010 standards, the switching frequency is the highest possible number of switchings per second.

# Mounting

## Mounting instructions for cylindrical forms

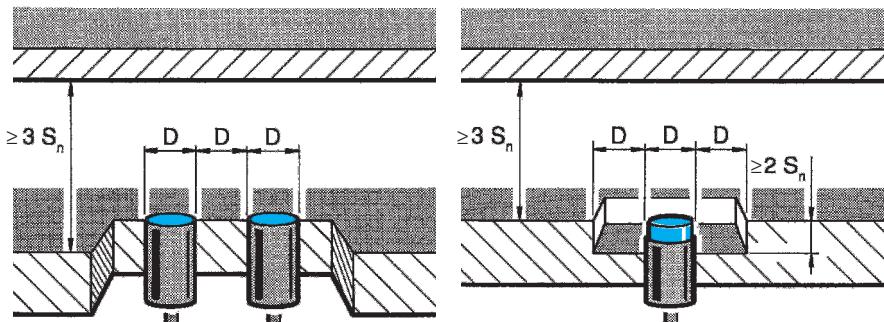

### ● shielded (flush) mounting

Sensor may be mounted flush in a metal plate.

Choice of carrier material can have an influence on sensing distance.

### ○ unshielded (non-flush) mounting

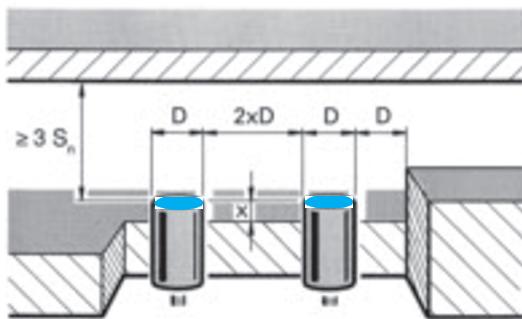

There must be a space equal to the diameter of the sensing head, with no metal interference. Following this rule the electrical field strength is less attenuated, which enables a larger sensing distance.

### ● quasi shielded mounting

When mounted in ferromagnetic material these sensors require a space (x) behind the active area that is free of metal.

Sensors can be installed shielded (flush) when mounted in non ferrous materials (colored metals etc.).

$x \geq 1/3 S_n$  for ferromagnetic material

$x = 0$  for all other materials

## Electrical and mechanical specifications

Voltage supply range +Vs	Maximum ripple 10 % of Vs. The supply voltage should not be higher or lower than the indicated maximum or minimum values.
Voltage drop Vd	This value indicates the maximum voltage drop measured across the conducting output.
Supply current	This is the maximum current consumed by the sensor, at nominal voltage, exclusive of output.
Oil resistant	The standard PVC cables as well as the PBT sensing faces are not made to operate continuously within an oily environment. PUR (polyurethane) cable options are available on both sensors and connectors.
Output resistance	3-wire proximity switches have a built-in load resistance. In case of high frequency switching an external load resistance can be connected in parallel in order to reduce the time constant.
Maximum cable length	A large cable length means a capacitive load for the output circuit and increases the influence of interference. Length should therefore be kept as short as possible.
Dimension	Normally the dimension refers to the width of the sensor, which for cylindrical body styles equals the diameter. Normally, the larger the body, the larger the coil and therefore the larger the sensing distance.
Reverse polarity protection	These sensors are protected against temporary reversed polarity voltage connection.
Max. Switching current	The maximum permissible load current passed through the sensor.
Output protection	All Baumer sensors are protected against back EMF.
Short circuit protection	Depending on the application, any sensor in our product range may be available with protection against short circuiting.
Magnetic fields	Strong magnetic fields might push the ferrite cores of the proximity switch into saturation. A proper switching is no longer guaranteed. Protective shielding is recommended.
NAMUR	NAMUR proximity switches change their current consumption as a metallic object approaches. The changed current consumption or the change in the internal resistance serves as the output signal. Together with suitable tested switching amplifiers, they can be used in an explosive environment.
Status display	Most of our proximity switches have an LED-display. It indicates the output switching status.
	The voltage supplied to the sensor should always be within the specified range for proper operation. Within this range a 10% ripple ( $V_R$ ) is allowed.
Connection cable	Most of our proximity switches are equipped with highly flexible PVC cable. If a high resistance against oil and grease is required, the cable material can be changed to PUR. For high temperature resistance a teflon cable is used. The standard cable length is 2 meters.

## Electrical and mechanical specifications

### Maximum installation torque

To avoid damage to the proximity switches during mounting, the default torque value should not be exceeded.

Stainless steel thread:

M4 = 1,8 Nm / M5 = 2 Nm / M8 = 10 Nm    M12 = 20 Nm / M18 = 55 Nm

Brass nickel plated thread:

M8 = 7 Nm / M12 = 15 Nm

M18 = 40 Nm / M30 = 200 Nm

Polybutylenterephthalate thread:

M12 = 1,5 Nm / M18 = 3 Nm

M30 = 15 Nm

(reduce torque values by 30% at the sensor's face)

The above data is valid for installations using the mounting nuts supplied with the sensor.

### Protection class

IP 65 1) Protection against penetration of dust and complete protection against contact with electrical components.

2) Protection against a water jet from any direction.

IP 67 The stipulations in 1) also apply here. In addition, this class provides protection against water when the housing is immersed in water under specified conditions of time and pressure (30 minutes at 1 m water depth).

IP 69 The stipulations in 1) also apply here. In addition, water directed from any direction under strong pressure against the housing must have no detrimental effects.

IP 69K Protection class IP 69K is an important standard for devices used in the food and automotive industries. It describes high-pressure cleaning with pure water at a pressure of 8,000 to 10,000 kPa and a temperature of +80 °C. The duration of exposure is 30 seconds in each position. As this test method differs significantly from the other IP tests, devices with the test label IP 69K do not automatically have protection class IP 67 or IP 68. Only devices in protection class IP 67 also have the lower protection classes.

### Mounting instructions for housings without threads

Heavy point loads on the housing, as can occur during fastening with grub screws, must be avoided (IFRM 03, 04, 06). Incorrect installation can cause irreversible damage to the proximity switch.

Various mounting aids are available for sensors without threads ( $\varnothing$  3,  $\varnothing$  4,  $\varnothing$  6,5).

### Cable dimensions

#### Housing diam. Wire diam.

$\varnothing$ 3	3 x 0,05 mm <sup>2</sup>	PVC
M5 / $\varnothing$ 4	3 x 0,08 mm <sup>2</sup>	PUR
M8 / $\varnothing$ 6,5	3 x 0,14 mm <sup>2</sup>	PVC
M12	3 x 0,25 mm <sup>2</sup>	PVC
M18	3 x 0,25 / 3 x 0,50 mm <sup>2</sup>	PVC
M30	3 x 0,50 mm <sup>2</sup>	PVC

## Function

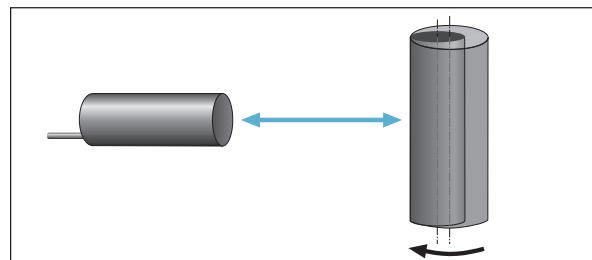

Inductive sensors with analog output signals are characterized by their short response times, high resolution and linearity as well as their outstanding repeat accuracy. The output current and voltage values are proportional to the distance between the sensor and the object being detected. In other words, they represent absolute measured values corresponding to the distance between the active surface and the object. These properties make inductively measuring linear sensors extremely interesting for numerous applications in the area of measurement and control engineering.

## Typical applications

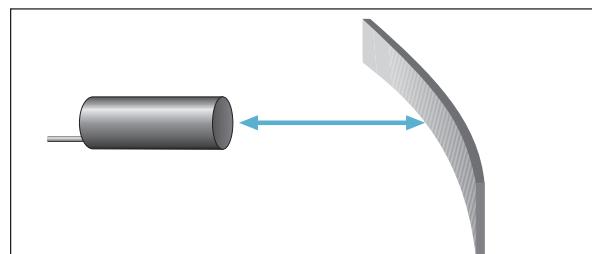

Travel / position / displacement

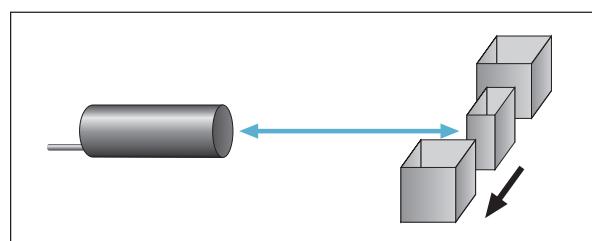

Diameter / eccentricity

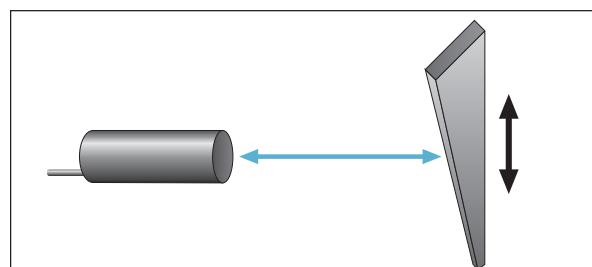

Deflection / deformation

Size comparison / measurement tolerance

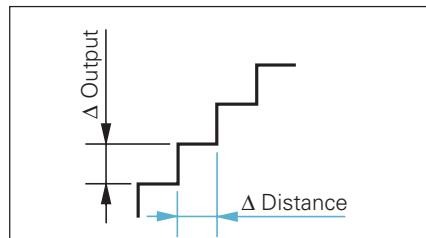

Taper / ramp

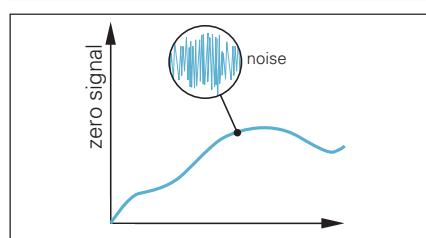

## Resolution in general

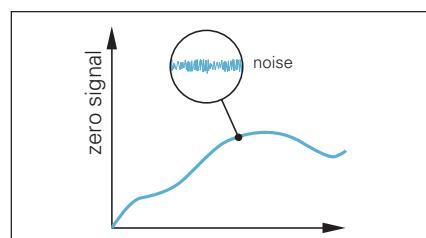

Resolution represents the smallest possible change in distance which will produce a measurable signal change at the sensor's output. Resolution can be impaired by high-frequency electrical interference (noise) or by the resolution of digital/analog converters.

## Dynamic resolution

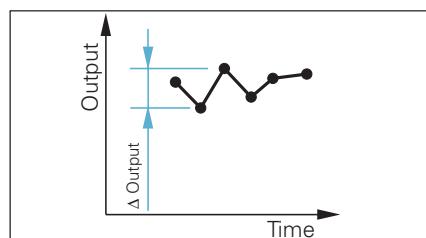

Signal noise exerts full effect on signal processing during very rapid measurements (high scan rates). Filtration without influencing the useful signal is only possible to a limited extent, if at all.

## Static resolution

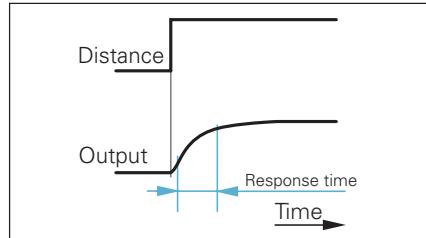

Very slow object movements (low scan rates) such as the temperature expansion of shafts allow the high-frequency interference to be filtered. The carrier signal is not influenced by this filtration. Using this technique significantly increases the resolution when compared to dynamic measurements.

## Repeat accuracy

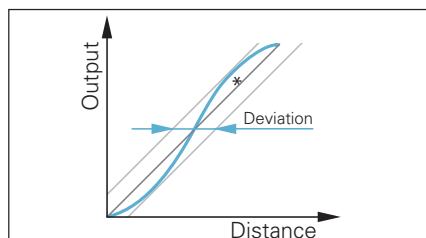

Repeat accuracy means the difference between the measured values of successive measurements within a period of 8 hours at an ambient temperature of  $23^\circ\text{C} \pm 5^\circ\text{C}$ .

## Response time

The time which the signal output of a sensor requires to rise from 10% to 90% of the maximum signal level is called the response time.

## FS Linearity

Linearity defines the deviation between the output signal and a straight line. It is given as a percentage of the measuring range end value (FS or Full Scale). The following alternatives are available for applications where the indicated linearity is insufficient:

- Sensors with linearized output curves
- Polynomials for the mathematical linearization of the sensor curve's in the controller

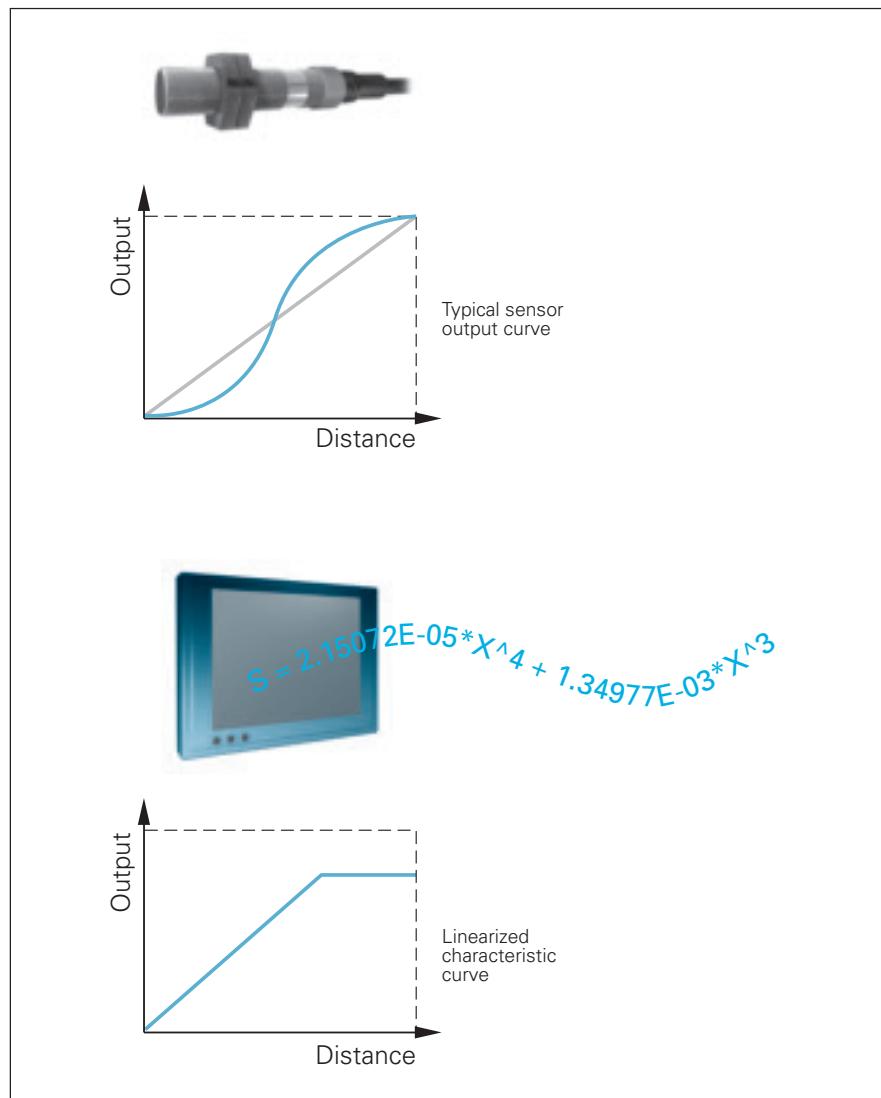

## Signal linearization with polynomials

### Polynomials are used when ...

Polynomials represent a mathematical function which converts a typical inductive analog sensor output curve into a linear signal. For example, it is integrated in the software of a programmable logic control to change the s-shaped sensor signal into a straight line.

- a linear signal progression is required across the entire signal range
- rapid measurements are to be performed
- no sensors with linear output curves are available for the intended measuring range
- an economical solution is desired

A variety of sensors with linear output curves are also available as alternatives.

## Functions

The following parameters can be altered using the Teach-in function:

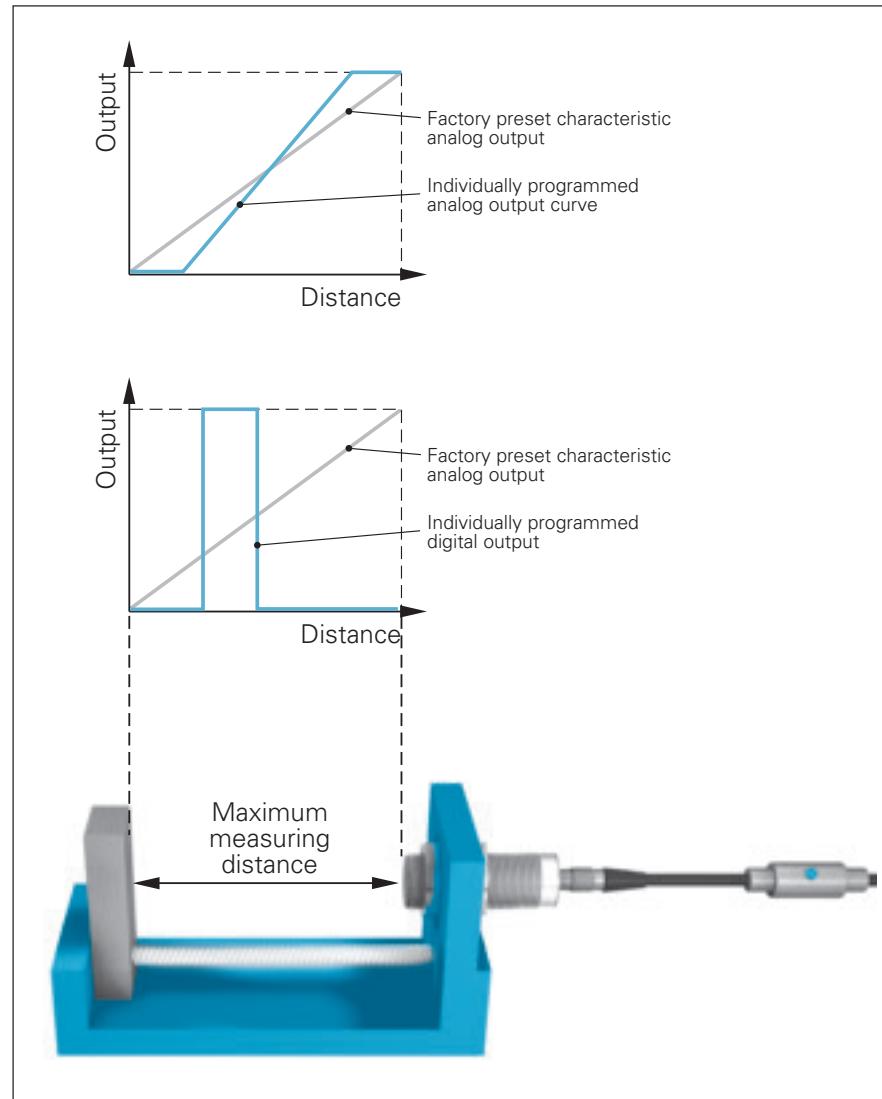

- Analog output (measuring range)
- Digital output (switching window)

## Procedure

The same Teach-in function menu structure is used for all sensors from Baumer, with the primary emphasis being on the simplest operation possible. This function allows the measuring range to be freely programmed within predefined limits. If, for example, a small measuring range with a large signal amplitude is desired, the range can be limited to merely a few millimeters. If necessary, the direction of the analog output's flow can be inverted, too.

In addition, the points at which one of the digital outputs switches on and off can be specified. These can lie either within or outside the individually programmed measuring range.

## Programmable output curve

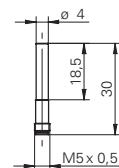

**Sd = 0 ... 1 mm**

## Inductive 3-wire sensors in harsh industrial applications

Inductive 3-wire sensors in harsh industrial applications

Sn = 0,8 mm

- Sensing probe 12 mm long
- Remote cable amplifier
- M8 x 1 quick disconnect

**general data**

mounting type	shielded
nominal sensing distance Sn	0,8 mm
hysteresis	2 ... 20 % of Sr
output indicator	3 port LED red

**electrical data**

switching frequency	< 3 kHz
voltage supply range +Vs	10 ... 30 VDC
current consumption max.	12 mA
voltage drop Vd	< 2 VDC
output current	< 100 mA
short circuit protection	yes
reverse polarity protection	yes

**mechanical data**

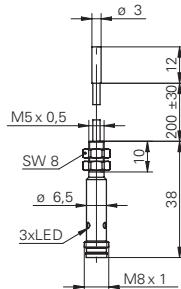

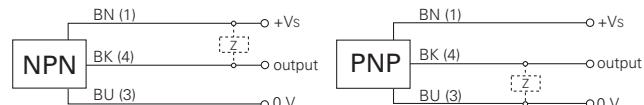

type	cylindrical smooth
material (sensing face)	Acrylate mod. PUR
housing material	stainless steel
dimension	3 mm
housing length	12 mm
connection types	connector M8

**ambient conditions**

operating temperature	-25 ... +75 °C
protection class	IP 67

**accessories**

clamping nut	Nr. 137021
connectors	ESG 32S, ESW 31S

**dimension drawing****connection diagrams**

order reference	output circuit
IFRM 03N1505/CS35L	NPN make function (NO)

IFRM 03P3505/CS35L	PNP break function (NC)

Sn = 0,8 mm

- Smallest sensor housing size
- Fully contained electronics
- 16 mm long version with individual strands

**general data**

mounting type	shielded
nominal sensing distance Sn	0,8 mm
hysteresis	2 ... 20 % of Sr

**electrical data**

switching frequency	< 3 kHz
voltage supply range +Vs	10 ... 30 VDC
current consumption max.	12 mA
voltage drop Vd	< 2 VDC
output current	< 100 mA
short circuit protection	yes
reverse polarity protection	yes

**Sn = 1 mm**

- Robust metal housing
- M8 x 1 quick disconnect
- 3 port LED

**general data**

mounting type	shielded
nominal sensing distance Sn	1 mm
hysteresis	2 ... 20 % of Sr
output indicator	3 port LED red

**electrical data**

switching frequency	< 5 kHz
voltage supply range +Vs	10 ... 30 VDC
current consumption max.	12 mA
voltage drop Vd	< 2 VDC
output current	< 100 mA
short circuit protection	yes
reverse polarity protection	yes

**mechanical data**

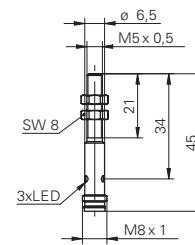

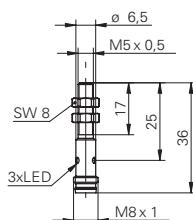

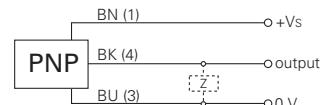

type	cylindrical threaded
material (sensing face)	LCP
housing material	stainless steel
dimension	5 mm
connection types	connector M8

**ambient conditions**

operating temperature	-25 ... +75 °C
protection class	IP 67

**accessories**

connectors	ESG 32S, ESW 31S

## Inductive code readers

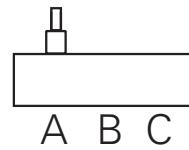

Inductive code readers are compact detection units available with 3-wire inductive proximity switches. The sensors have a common voltage supply but provide individual outputs.

A typical application for the code reader would be for identifying changeable tool heads on complex handling or machining units. Prior to the code reader, several individual sensors were needed, which required individual mounting and set up. Now the inductive code reader can be installed, bringing considerable cost savings in both installation and service.

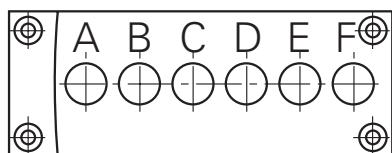

### Sensor outputs 3 heads

dimension	8 mm
connection types	cable

**ambient conditions**

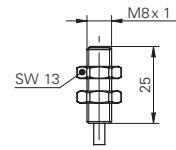

operating temperature	-25 ... +75 °C
protection class	IP 67

**safe maximum values**

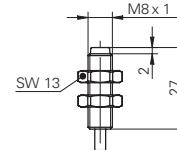

EC-type-examination Certificate	PTB 03 ATEX 2146
marking	II 1G EEx ia IIC T5/6
current $I_i$	< 37 mA
voltage $U_i$	< 13,5 VDC
power $P_i$	< 0,125 W
internal capacitance $C_i$	< 50 nF
internal inductance $L_i$	< 0,2 mH
operating temperature $T_a$ (temp. class T5)	-20 ... +60 °C
operating temperature $T_a$ (temp. class T6)	-20 ... +40 °C

**remarks**

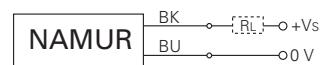

available with connector S35

**dimension drawings**

shielded

unshielded

**connection diagram****operating data according to EN 50227**

+Vs	= 8,2 V
R <sub>L</sub>	= 1 kΩ
T	= 20 °C
Sn at 1,8 mA	

for applications in hazardous areas

order reference	nominal sensing distance Sn	mounting type	housing length
IFRM 08X9103	2 mm	unshielded	27 mm
IFRM 08X9503	1,5 mm	shielded	25 mm

**Sn = 2 mm / 4 mm**

- Circuit board mountable
- Pin-spacing 5 mm
- Shielded and unshielded versions

**electrical data**

switching frequency	< 2 kHz
normal operating voltage	8.2 VDC
voltage supply range +Vs	5 ... 30 VDC
current consumption undamped	> 4 mA
current consumption damped	< 1 mA
current consumption max.	10 mA
residual ripple	< 10% Vs

**mechanical data**

type	cylindrical smooth
housing material	PBT
dimension	10 mm
housing length	6,5 mm
connection types	print
<b>ambient conditions</b>	
operating temperature	-25 ... +75 °C
protection class	IP 67

**order reference**

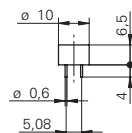

<b>IFR 10.82.01</b>
<b>IFR 10.82.05</b>

**nominal sensing distance Sn**

4 mm
2 mm

**mounting type**

unshielded
shielded

**dimension drawing****connection diagram**

Sn = 2 mm / 4 mm

- Shielded and unshielded versions

**electrical data**

switching frequency	< 2 kHz
normal operating voltage	8,2 VDC
voltage supply range +Vs	5 ... 30 VDC
current consumption undamped	> 4 mA
current consumption damped	< 1 mA
current consumption max.	10 mA
residual ripple	< 10% Vs

**mechanical data**

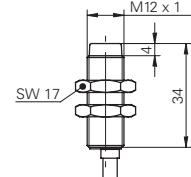

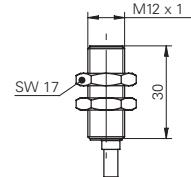

type	cylindrical threaded
housing material	brass nickel plated
dimension	12 mm
connection types	cable

**ambient conditions**

operating temperature	-25 ... +75 °C
protection class	IP 67

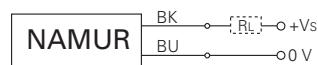

**safe maximum values**
